7 Things Banks Can Do Today to Streamline nCino Deployments

Leveraging AutoRABIT's DevSecOps platform and adherence to best practices streamline nCino deployments and enable banks to maintain secure and productive DevOps pipelines.

Here are seven ways banks of all sizes can streamline application deployments on the nCino operating system.

1 //

Implement CI/CD

A reliable CI/CD framework streamlines nCino deployments for worry-free releases and a reduction of manual work. CI/CD tools have the necessary layers of testing to find and flag potential errors before they make it to a live environment.

2 //

Standardize Environments

Standardizing production, testing, and development environments minimizes discrepancies and reduces the chances of encountering environment-specific issues during deployment. Utilizing Salesforce release management tools like a data loader keeps these environments consistent, eliminating confusion and streamlining deployments.

3 //

Automate Testing

Automated testing—including static code analysis, integrations tests, and unit tests—provides the coverage and consistency needed to guarantee smooth deployments. The goal is to only deploy high quality code. Automating multiple layers of testing is the only way to guarantee this happens.

4 //

Monitor Monthly Updates

nCino's monthly updates are incremental improvements to an already great platform—but you need to implement these updates to see the improvements. AutoRABIT helps manage these monthly improvements so you can focus on serving your banking customers.

5 //

Document Everything with Version Control

Version control is a critical tool for large DevOps teams to encourage collaboration and provide a simple remediation tactic when accidents occur. Time stamps and personal identifiers for updates to the code repository simplify the process of resetting a project after an error is identified.

6 //

Protect and Maintain Metadata

Risk reduction, privacy, and consistent quality levels are all benefits of a strong metadata management strategy. Preserving your nCino metadata is part of a comprehensive data governance strategy that serves your larger Salesforce instance.

7 //

Foster a Culture of Collaboration

Encourage team members to ask questions and make suggestions at any point throughout the application lifecycle. Keeping everyone informed and aligned streamlines processes leading up to nCino deployments.

"We are excited about our strong partnership with AutoRABIT, which has been instrumental in expediting nCino customer installations with cutting edge features for banks and credit unions. By working with AutoRABIT, we can ensure seamless deployments for our customers that accelerate their adoption journey, taking full advantage of our significant R&D investments. This collaboration not only enhances our ability to provide timely updates but also strengthens nCino's commitment to delivering exceptional value to the global banking industry. With AutoRABIT, our customers have a trusted solution that has proven instrumental in our joint customer successes."

Ryan Atkins, *nCino EVP of Global Customer Success, nCino*
